

January 2003

To: DQvista Sites
From: Decision Support Inc.

Version 5.32.0028 contains the enhancements described in this letter. See the readme.txt file on the DQpowersuite CD for more information about installation and the other components of the DQpowersuite.

New features

More control over email header information

You can now specify the subject information for an email file attachment. It is set to 'DQvista Report Attachment "DQvista Report"' by default. You can change it to something more descriptive if you want. You can now also use the File option to name the html file that will contain the report and be attached to the email.

DQvista can now pass expressions rather than their results in drill-downs

When you create links to reports that use runtime input for runtime virtual fields, DQvista now allows you to pass a value for the logic to the second report. You can now pass the runtime input as an expression rather than the result of that expression. There is an **Add Expression** button in the **Runtime Input** dialog box. The **Add Expression** button is enabled only when the runtime parameter is a virtual field. When you choose the button, a list appears containing the virtual fields in the spec. You can select the virtual field and DQvista will pass the expression as a parameter to the spec you are linking to at runtime.
